

Sage.Education at Bialik

Welcome. It's the end of the year, and the last thing you need is another tool to learn. So today we'll mostly *show* you a few things and let you get to summer. This page is yours to keep.

What Sage.Education is

Sage.Education is two things at once: a **guide** and a **platform**.

- **A guide.** We help your whole school *read* AI — what it does, what it doesn't, and how to teach with it. That's AI literacy plus a full curriculum, built for educators, students, parents, even the front office.
- **A platform the school owns.** Sage is an open-source AI workspace that lives on the school's system. It's **role-aware** (admins, facilitators/teachers, and learners each see a view that fits them), **everything is editable** (nothing is locked away), and your **data stays with the school** — it doesn't leave for a company in California.
- **A partner.** When you want a tool that doesn't exist yet, we help you build it — your own AIs, shaped around your classroom, no code required.
- **A student Junior Internship.** Young people (16–20) build and shape real AI on this same platform — learning by *making*, not just using.

What it is not: *not a rented black box whose terms change overnight, and not a teacher replacement. You stay in charge. The AI is a tool you shape, not a substitute for you.*

Today's agenda — the four things we offer

#	Offer	In one line
1	AI guidance, literacy & curriculum	We help everyone read AI, with a modular curriculum per audience.
2	The platform you own	Your own AI workspace — your data, your rules, role-aware views.
3	Build your own AI	Make a classroom tool over a coffee — no code, a couple of minutes.
4	The Junior Internship	Students build real, open-source AI by making, not just using.

Each one comes with a short hands-on moment. Watch one screen together; you don't need to log in.

What's next

- **An in-person Maker-Mindset workshop — late August / early September.** Hands-on, building things, the natural next step from today: *the maker mindset, and how it applies to AI*.
- **Bialik's own platform instance — this fall.** Your school gets its own instance of the Sage.Education platform: **your data, your rules, your agents**. We'll set up a short call with admin to pick what's turned on for day one.

Curious already? *If anything today made you think "could it do X for my class?" — tell us the X. We want to wire it up. Scan the link on the closing slide, or visit **sage.education**.*

A small AI glossary

Plain-language definitions for the words you'll hear today and after.

- **LLM (large language model)** — A statistical word-predictor trained on a huge amount of text. It ranks the *likely next words* rather than looking up stored facts, so fluent, confident output does **not** mean true output.
- **Model** — A specific trained AI system. There are many, and they differ: the same request sent to two models can come back two different ways. That variety is a feature, not a glitch.
- **Prompt** — What you type or ask the AI to do. A clear, specific prompt gets a more useful first draft; a vague one gets a vague answer.
- **AI agent** — An AI that doesn't just answer a question but **takes actions** for you: browsing the web, filling a form, sending a message, completing a multi-step task.
- **Agentic AI** — The broader category of AI that acts rather than just answers. Individual systems in that category are called **agents**. The field is shifting from AI that *answers* toward AI that *does* — worth knowing it's coming.
- **"The algorithm" (the AI you already use)** — Much of what companies now market as "AI" is what they used to call "the algorithm": YouTube recommendations, Spotify playlists, spam filters, predictive text, navigation. Often the *label* changed before the system did. You've been using AI for years.
- **Hallucination / confabulation** — When an AI states something false with total confidence — a fake quote, an invented citation, a wrong-but-plausible fact. It isn't lying; it's guessing likely words. **Confident is not the same as correct** — always check anything that matters.
- **Maker mindset** — Treating AI as a starting point to build on, where *you* are the author of the final result and the AI is a material you shape. The opposite of the "answer-vending machine" habit. It's the theme of our fall workshop.
